## ABSTRACT

A brief description is given of the shock table at Roorkee, India, which is capable of destroying 20-ton structures by imparting horizontal foundation shocks of up to 2g. A year's program of testing earth or low grade masonry structures on this table is planned. This paper lists a number of alternatives concerning how to test and what to test, from which the testing program will finally be determined. It is requested that readers transmit to the author their recommendations about the matters listed or other matters relating to the project.
