## I. Background

Information systems to be of any value at all, have to be utilized and to be utilized they have to be simple. Management is primarily an exercise of taking information and making appropriate decisions for action based upon same. To the extent that we can improve the quality of information and the speed in which it is presented to the manager we will theoretically improve his ability to take action. The entire thrust of this proposal is to develop and test a system-which:

1. Improves the quality of data available to the manager of a disaster situation.
2. Decreases the time needed to present this information in an interpretable form.
3. Does all of the above using technology which will be highly reliable under harsh circumstances with lower power requirements and a high degree of portability.

In a recent conference sponsored by the Disaster Surveillance Division of the Pan American Health Organization (PAHO) and the United Nations Office of Disaster Relief (UNDRO) combining international organization functionaires with political and administrative personnel who had actual experience with managing disasters, it became evident that no consensus had been reached regarding a precise set of indicators which could be applied to a given disaster situation (sudden impact disaster only). Furthermore, the high number of possible combinations of events means that the, normal standardization and observation needed for epidemiological studies is almost impossible using

traditional methods. Based upon the recognized need for the improved levels of information and the availability of increasingly high performance and portable micro-computing devices we propose a pilot study that would address some of these problems as a first step toward a full fledged disaster information system for use in sudden impact disasters.

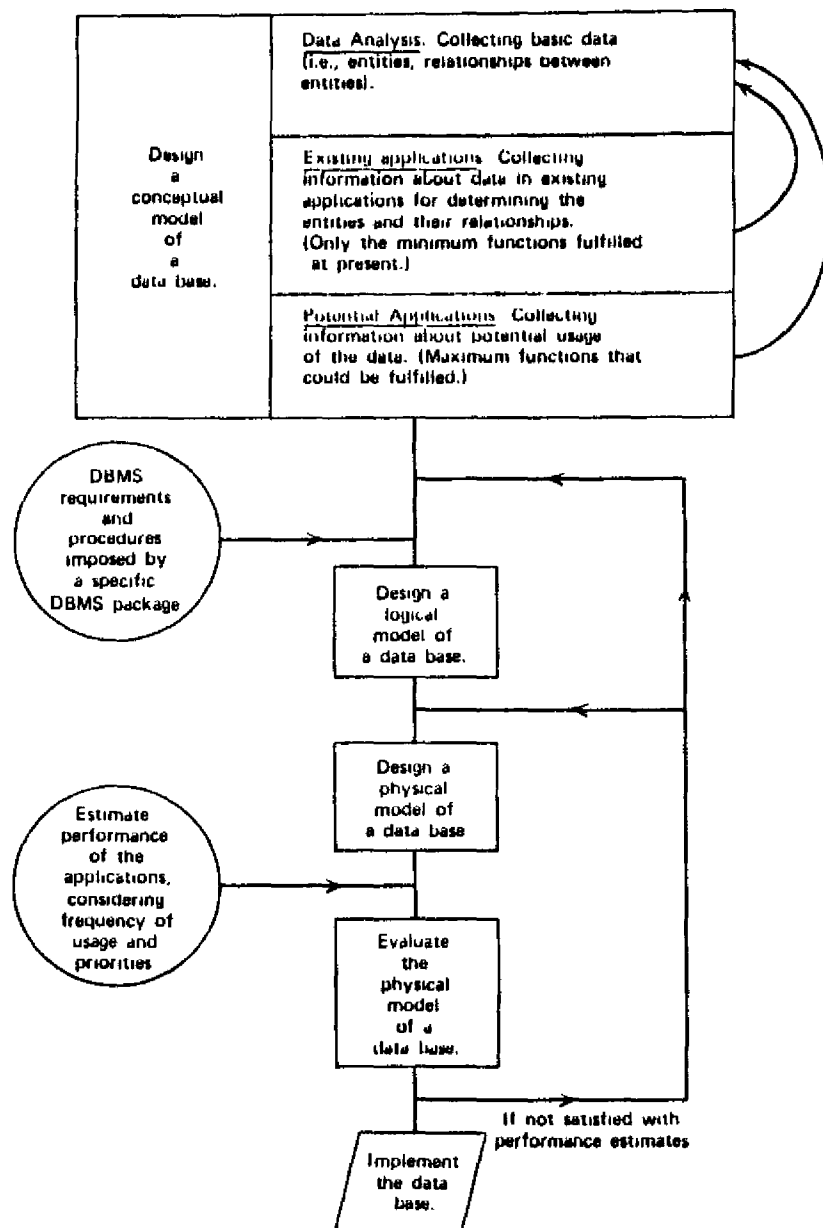

Figure 1 represents the major steps in the development of an information system of any kind and provides an ordering device for what we plan to do as part of this proposal.

## II. Development of a Conceptual Framework and/or Indicator Model

Here our procedure has been to first review the literature with specific reference to indicators which might be utilized as part of the action model. Unfortunately, the literature is very sparse with no work which precisely addresses the issue raised. When no consensus has been reached among the experts, a strong argument can be made that only people who have had direct experience with disaster situations can contribute to the specification of a coherent and functional conceptual model for developing an effective management information system. The following proposal and list of indicators (Appendix A) is a direct continuation of the results from the "Delphi" approach utilized at the PAHO/UNDRO disaster conference.

Figure 1

Steps in the development of a data base to be used in a management information system

III. General Principals in the Design and Implementation of a Management Information System (MIS)

A. Operational Definitions

MIS A management information system permits the integration of data across the operational boundaries of an organization. A MIS includes programs (software), equipment (hardware), personnel and procedures which integrate a data base into a form in which it can supply the different points of view of the diverse users and personnel who manage and direct the system.

Data base A collection of related data with different uses, applications and points of view. These different points of view only come into being after the data has been rearranged and sorted.

Information Data which has been arranged for decision-making purposes. The utility of the products of a MIS depend on the quality of thought and planning which go into the system before its implementation.

Principal causes of failure in the implementation of an MIS\*

1. It addresses a wrong or irrelevant problem.
2. Behavioral factors have been overlooked.
3. Management support or involvement in the design stage has

\*

Adapted from McCosh et al (1981)

been lacking.

These problems are always more severe when the design of the system is left to technical specialists instead of including the personnel, who will be involved in the use and operation of the system, in the design stage and creation of the conceptual model (Figure 1).

#### IV. The Needs Assessment Stage in the Development of an MIS

This crucial stage is most often overlooked in the development of a management information system. Ultimate failures or shortcomings are often due to lack of sufficient preparation at this stage. Too many directors of programs leave this stage to the technical specialists only to be disappointed with the lack of relevance and applicability of the results to the problem at hand.

##### A. Development of a conceptual model of the enterprise

This includes a listing of all of the departments, programs, individuals, and their relationships. This is the time for updating organigrams, flow charts, job descriptions and most important of all clear operational definitions of the elements and activities of the enterprise. Without this last part, it would be impossible to systematize a coherent data base to order the information necessary for making decisions.

B. Identification of users of the system

A thorough effort should be made to identify every current and potential user of the system both inside and outside of the organization. Different users of a system always have different points of view of its structure and purpose and this is the stage to begin reconciling them.

C. Specification of the uses or products of the system

Probably the key step in the whole process, this must be done by the users identified in the previous step and is often a laborious and drawn-out process. The users must specify what information they need with what periodicity. Dummy reports, graphs, tables and charts should be prepared. Getting busy program managers to specify what they need can be a tedious affair because many of them, especially in the health and medical fields, are not accustomed to addressing this type of conceptual problem and probably hope that a technician can deliver a ready made system for their use. Unfortunately, the technician usually possesses limited knowledge of the managers' needs and is not capable of providing the necessary output by himself.

V. The Proposal

The current proposal envisions three phases in the creation of a microcomputer based information system for disaster control and management using hurricanes as the target disaster.

A. Phase I.. The Needs Assessment Phase (26 weeks)

This phase will include:

1. Development of initial conceptual model of the problem.
2. Identification of the users, uses and products desired from the system.
3. Completion of the conceptual model including final identification of the indicators to be included and complete specification of the data files, records and elements and their relations into a network conceptual model of the data base.

B. Phase II. The Testing/Simulation Phase (34 weeks)

This phase will include

1. Translation of the conceptual model to a logical model and then into a physical data base (Figure 1).
2. Testing of the model by running computer simulations at selected sites. One of the main advantages of computer technology in managing disasters is that one need not wait for a hurricane to determine if the system works.

3. Revision of the system and preparation of all documentation necessary for its implementation.

The final MIS developed by Tulane will feature ease of use operation so that it can be managed by people with little or no training or computer expertise.

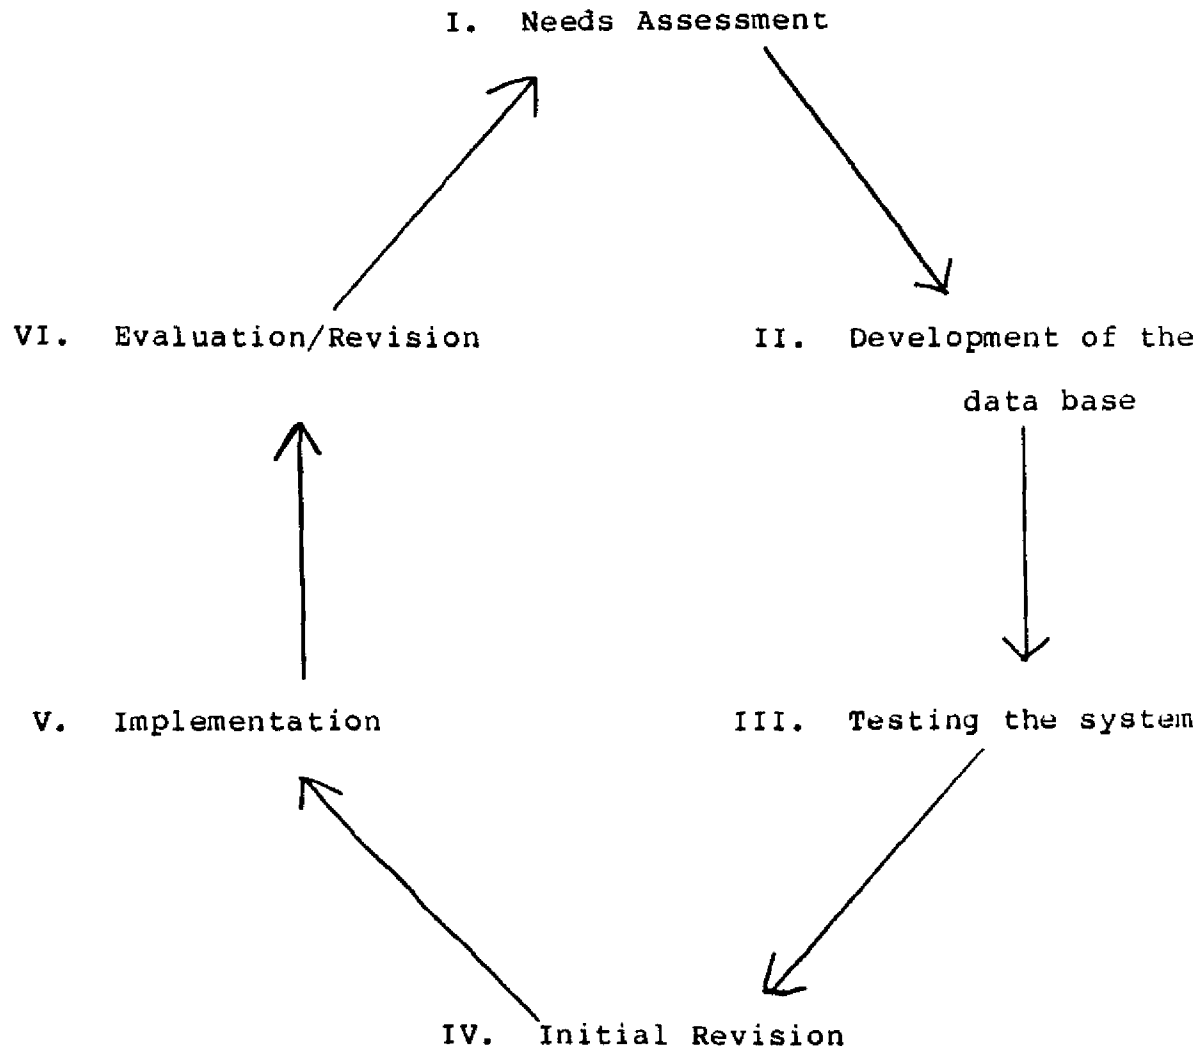

The documentation will include all instructions necessary for the operation of the system, routine maintenance and protection of the integrity of the data in disaster situations.

C. Phase III. Implementation of the System and Ongoing Evaluation/Revision (Figure 2)

This proposal includes Tulane participation only through the first and second phases.

Figure 2

Stages in the development of a management information system

VI. Chronogram for Phase I

| <u>#</u> | <u>Activity</u>   | <u>Weeks</u> |
|----------|---|--------------|
| 1.       | Confirm agreement between Tulane and PAHO   | 0            |
| 2.       | Development of initial conceptual model at Tulane including:<br>A. Data to be inventoried<br>1. Resources<br>2. Population-based statistics<br>B. Data to be collected for damage assessment<br>1. Resources<br>2. Population-based statistics<br>C. Methodology for comparing usable resources left after damages with needs of population to ascertain rapidly the amount and type of emergency aid necessary | 1-6          |
|          | Included in the model will be flow charts of the activities involved in the decision making process.  |              |
| 3.       | Identification by PAHO of 2 Caribbean counterparts for development and testing of the models. The 2 sites should be as different as possible to help ensure the generalizability of the final product to a variety of field situations.   | 1-4          |
| 4.       | Delivery of written draft of model by Tulane to PAHO and Caribbean counterparts for their review.   | 7-8          |
| 5.       | Meeting with PAHO in Washington to review and revise the model.   | 9            |
| 6.       | Further revision at Tulane in preparation for first Caribbean site visit.   | 10-11        |
| 7.       | First visit to Caribbean counterparts to confront the conceptual model with the local reality of what is necessary, available and possible. One week will be spent at each site.  | 12-13        |
| 8.       | Further revision at Tulane to incorporate suggestions from the field and to make the model adaptable to both the two different test sites and more generalized situations.  | 14-16        |

9. Delivery of second draft of model to PAHO and the Caribbean counterparts incorporating experience from the field for their review. 17-18
10. Second meeting with PAHO in Washington to review and revise the model. 19
11. Further revision at Tulane in preparation for the second Caribbean site visit. 20
12. Second site visit to Caribbean counterparts. 21-22
13. Preparation of the finalized conceptual model at Tulane to be programmed and simulated in Phase II. 23-26

VII. Chronogram for Phase II

| <u>#</u> | <u>Activity</u>  | <u>Weeks</u> |
|----------|--|--------------|
| 1.       | Completion of report from Phase I.   | 0            |
| 2.       | Development and testing of logical and physical model of MIS at Tulane by the Programmer in conjunction with the Research Associate. | 1-12         |
| 3.       | Visit to PAHO in Washington by the Research Associate and the Programmer to present the first version of the MIS.                    | 13           |
| 4.       | Revision of the MIS at Tulane in preparation for Caribbean site visit.   | 14-16        |
| 5.       | Visit to Caribbean sites by the Research Associate and Programmer to test the MIS and run first simulations.                         | 17-18        |
| 6.       | Revision of MIS at Tulane to incorporate experience from the field.  | 19-21        |
| 7.       | Second visit to PAHO in Washington by Research Associate and Programmer to present and evaluate revised model.                       | 22           |
| 8.       | Revision of MIS at Tulane in preparation for second Caribbean site visit.  | 23-25        |
| 9.       | Second visit to Caribbean counterparts by Research Associate and the Programmer to field-test the MIS and run final simulations.     | 26-27        |
| 10.      | Completion of MIS and complete documentation necessary for its implementation (Phase III).   | 28-34        |

C. Notes to the Budget

1. The cost of the plane ticket based on the price of a New Orleans-Jamaica-Barbados-New Orleans round trip. The actual cost will depend upon the sites selected by PAHO.
2. Based on peak season rates in Jamaica and Barbados, U.S. Department of State, Standard Regulations (Government Civilians, Foreign Areas) Maximum Travel Per Diem Allowances for Foreign Areas.
3. Developments in micro-computer technology and software are progressing so rapidly that it would be best to wait until the beginning of Phase II for the purchase of the equipment. Meanwhile, the prices are holding constant or even decreasing.

SOURCE: Development of Indicators for Monitoring Progress Towards Health for All by the Year 2000, WHO, 1981.

## INDICATORS

Definition: variables which help to measure changes and which are used as markers toward reaching objectives and targets; reflections of a given situation.

### Characteristics:

1. Valid - accurate; measure what is supposed to be measured
2. Objective - precise; results are similar if measured by different people under similar circumstances
3. Sensitive - sensitive to changes in the situation
4. Specific - should reflect changes only in the situation concerned

### Levels of Application to the Monitoring of Implementation and Evaluation of Impact:

1. Policy
  - a) national
  - b) subnational
  - c) local/community
2. Managerial/Technical
  - a) national
  - b) subnational
  - c) local/community

HURRICANE MODEL

1. Assume that rain and wind are primary climatic elements of hurricanes.
2. Definitions of I and II:

I. Identified areas for consideration:

- health
- environmental sanitation
- infrastructure
- food

Reference: Disaster Needs Assessment Conference  
May, 1984

II. Direct destruction to infrastructures

- hazard analysis
- vulnerability analysis

These are primarily architectural/engineering concerns.

3. Four possible combinations of resulting conditions (i.e., after the hurricane) are seen:

1) FD

2)  $F\bar{D}$

3)  $\bar{F}D$

4)  $\bar{F}\bar{D}$

KEY:

F - Flood

D - Destruction

These point to the intensity of the disaster and are the equivalent of the dose-response phenomenon in the classic epidemiology sense.

4. Each of the above conditions dictates the particular area(s) for consideration.

1) FD ==> I + II

2)  $F\bar{D}$  ==> I

3)  $\bar{F}D$  ==> II

4)  $\bar{F}\bar{D}$  ==> do nothing

## BASELINE INFORMATION

|---|--|--|
| Annual production of electricity, Gw          | plant records<br>Ministry of Interior records    | indication of expected electricity output                  |
| Capacity of backup system for electricity, Mw | plant records<br>Ministry of Interior records    | indication of capacity for emergency services              |
| Line capacity for electricity, Kv             | plant records<br>Ministry of Interior records    | indication of transmission capability of electrical system |
| Kilometers of lines, primary and secondary    | plant records<br>Ministry of Interior records    | indication of distribution capacity of electrical system   |
| Personnel for energy sector, man-hours        | Ministry of Interior                             | indication of manpower capacity of electrical system       |
| Area served by radio, km <sup>2</sup>         | Ministry of Communications<br>survey of stations | indication of capacity of radio communications             |
| Number of telephone hookups                   | Ministry of Communications                       | indication of capacity of telephone system                 |
| Number of telegraph/telex systems             | Ministry of Communications                       | indication of capacity of telegraph/telex systems          |

**Infrastructure**

|  |   |  |
|--|---|--|
| Personnel for communications sector, man-hours                       | Ministry of Communications                    | indication of manpower capacity of sector  |
| Types of building codes  | Ministry of Interior                          | guidelines for reconstruction with possible alterations in code for hurricane-proof measures |
| Volume of traffic/ major route, road or railway                      | Ministry of Transportation                    | indication of normal traffic conditions  |
| Type of traffic/ major route, road or railway                        | Ministry of Transportation                    | indication of transport types per route  |
| Personnel for transportation sector, man-hours                       | Ministry of Transportation                    | indication of manpower capacity of sector  |
| Number of airport runways  | Ministry of Transportation<br>airport records | indication of operating capacity of airports   |
| Number of arrivals and departures by aircraft type, daily and weekly | Ministry of Transportation<br>airport records | indication of volume of airport traffic  |
| Airport personnel, man-hours   | Ministry of Transportation<br>airport records | indication of manpower capacity of air system  |

INDICATOR INFORMATION FILE

Indicator: Number of individuals without adequate food by age

Program Area: Emergency Food

Data Source(s): reports from heads of communities and institutions  
individuals of affected communities

Method(s) of Collection: interview  
survey

Level(s) of Aggregation: community

Information Required for Policy Decision:  
Estimation of population without adequate food supply

Time (periodicity): 0-7 days, daily

Policy Decision(s):  
Dispatch (or not) of food to affected community  
Allocation of resources

Reference(s): Disaster Needs Assessment Conference, May 1984

Observation(s):

INDICATOR INFORMATION FILE

Indicator: Requirements for food distribution

Program Area: Emergency Food

Data Source(s): distribution point records

Method(s) of Collection: survey

Level(s) of Aggregation: community/national

Information Required for Policy Decision:  
Final review of food needed

Time (periodicity): 31-365 days

Policy Decision(s):

Assignment of resources: equipment, materials, personnel, money

Reference(s): Disaster Needs Assessment Conference, May 1984

Observation(s):

INDICATOR INFORMATION FILE

Indicator: Quantity of food distributed by type

Program Area: Emergency Food

Data Source(s): distribution point records

Method(s) of Collection: survey

Level(s) of Aggregation: community/national

Information Required for Policy Decision:  
Review of food needed

Time (periodicity): 31-365 days

Policy Decision(s):  
Solicitation of additional quantities by type

Reference(s): Disaster Needs Assessment Conference, May 1984

Observation(s):

INDICATOR INFORMATION FILE

Indicator: Number of persons who require food in affected areas

Program Area: Emergency Food

Data Source(s): individuals of affected community  
community heads  
institution heads

Method(s) of Collection: interview  
survey

Level(s) of Aggregation: community/national

Information Required for Policy Decision:  
Estimate of population requiring food

Time (periodicity): 31-365 days

Policy Decision(s):  
Continuation (or not) of food aid

Reference(s): Disaster Needs Assessment Conference, May 1984

Observation(s):

INDICATOR INFORMATION FILE

Indicator: Requirements for food distribution

Program Area: Emergency Food

Data Source(s): distribution point records

Method(s) of Collection: survey

Level(s) of Aggregation: community/national

Information Required for Policy Decision:  
Review of food needed

Time (periodicity): 8-30 days

Policy Decision(s):  
Assignment of resources: equipment, materials, personnel, money

Reference(s): Disaster Needs Assessment Conference, May 1984

Observation(s):

INDICATOR INFORMATION FILE

Indicator: Quantity of food distributed by type

Program Area: Emergency Food

Data Source(s): distribution point records

Method(s) of Collection: survey

Level(s) of Aggregation: community/national

Information Required for Policy Decision:  
Review of food needed

Time (periodicity): 8-30 days

Policy Decision(s):  
Solicitation of additional quantities by type

Reference(s): Disaster Needs Assessment Conference, May 1984

Observation(s):

INDICATOR INFORMATION FILE

Indicator: Number of persons who require food in affected area

Program Area: Emergency Food

Data Source(s): individuals of affected community  
community heads  
institution heads

Method(s) of Collection: interview  
survey

Level(s) of Aggregation: community

Information Required for Policy Decision:  
Estimate of population requiring food

Time (periodicity): 8-30 days

Policy Decision(s):  
Continuation (or not) of food aid

Reference(s): Disaster Needs Assessment Conference, May 1984

Observation(s):

INDICATOR INFORMATION FILE

Indicator: Inventory of institutions that can provide food

Program Area: Emergency Food

Data Source(s): community heads  
institution heads

Method(s) of Collection: interview  
survey

Level(s) of Aggregation: community

Information Required for Policy Decision:  
List of institutions for possible distribution mechanisms

Time (periodicity): 0-7 days

Policy Decision(s):  
Review of distribution mechanisms

Reference(s): Disaster Needs Assessment Conference, May 1984

Observation(s):

INDICATOR INFORMATION FILE

Indicator: Number of vehicles and types required to transport food

Program Area: Emergency Food

Data Source(s): local/national transportation department  
military

Method(s) of Collection: interview  
survey

Level(s) of Aggregation: community/national

Information Required for Policy Decision:  
Immediate requirements for transport

Time (periodicity): 0-7 days

Policy Decision(s):  
Requisition of vehicles and special supplies

Reference(s): Disaster Needs Assessment Conference, May 1984

Observation(s):

INDICATOR INFORMATION FILE

Indicator: Quantity of food necessary

Program Area: Emergency Food

Data Source(s): nutritionists  
PAHO/WHO publications on nutritional emerge

Method(s) of Collection: consultation/interview  
library research

Level(s) of Aggregation: community

Information Required for Policy Decision:  
Amount of food to assure adequate supply

Time (periodicity): 0-7 days

Policy Decision(s):  
Solicitation of appropriate quantities

Reference(s): PAHO/WHO guidelines

Observation(s): Calculations are available

INDICATOR INFORMATION FILE

Indicator: List of unacceptable foods

Program Area: Emergency Food

Data Source(s): community members

Method(s) of Collection: interview

Level(s) of Aggregation: community

Information Required for Policy Decision:

Types of foods that are culturally appropriate to a community

Time (periodicity): 0-7 days

Policy Decision(s):

Solicitation of culturally appropriate foods

Reference(s): Disaster Needs Assessment Conference, May 1984

Observation(s):

INDICATOR INFORMATION FILE

Indicator: Morbidity by age

Program Area: Epidemiologic Surveillance

Data Source(s): health service records

Method(s) of Collection: survey

Level(s) of Aggregation: community

Information Required for Policy Decision:  
Determination of existence of an epidemic  
Requirements for medication and supplies

Time (periodicity): 0-365 days

Policy Decision(s):  
Requirements for vaccination  
Requirements for quarantine  
Solicitation of local or outside aid

Reference(s): PAHO Scientific Publications  
Inundaciones 1982. Ministerio de Salud - Bolivia

Observation(s): Consolidate information at central level; diseases i  
nclude respiratory, GI, malaria, snake and dog bites

INDICATOR INFORMATION FILE

Indicator: Estimation of damages of hospital's electrical system, %

Program Area: Infrastructure

Data Source(s): hospital administration/maintenance records

Method(s) of Collection: interview  
survey

Level(s) of Aggregation: community

Information Required for Policy Decision:  
Estimation of magnitude of damage to electrical system

Time (periodicity): 0-7 days, daily

Policy Decision(s):  
Utilization of backup generators

Reference(s): Disaster Needs Assessment Conference, May 1984

Observation(s):

INDICATOR INFORMATION FILE

Indicator: Estimated repair time (TR, days and TRC, days)

Program Area: Infrastructure

Data Source(s): National Emergency Committee records

Method(s) of Collection: survey

Level(s) of Aggregation: community/national

Information Required for Policy Decision:

Requirements for rehabilitation: execution plan

Time (periodicity): 31-365 days

Policy Decision(s):

Execution plan

Reference(s): Disaster Needs Assessment Conference, May 1984

Observation(s): TR = rehabilitation time

TRC = combined rehabilitation time
