PROYECTO OROSI- VULNERABILIDAD GEOTECNICA No. 609  
 Descripción Potencial de Licuación  
 Calculó J. Purand Revisó  Fecha 27/ Sept/94 Hoja 1 de 7

EVALUACION DEL POTENCIAL DE LICUACION  
 VALLES DEL GUARCO Y DE CORIS  
 PARAISO - CARTAGO, COSTA RICA.

Del estudio de Geomatrix Consultants:

Sismo: Magnitud,  $M : 6\frac{3}{4}$

Aceleración horizontal pico en superficie de suelo,  $A_{\max}$ :

| $T_R$<br>años | $A_{\max}$ | probab. excedenc.<br>en 50 años de opert. |
|---------------|------------|-------------------------------------------|
| 50            | 0.34 g.    | 64%                                       |
| 100           | 0.41 g.    | 40%                                       |
| 500           | 0.58 g.    | 10%                                       |

Se evaluará el potencial de licuación para:

- $M = 6\frac{3}{4}$  (Magnitud)
- $A_{\max} = 0.35g, 0.45g, 0.55g.$
- $\gamma_T$  suelo:  $1.9 \text{ t/m}^3$
- Profundidad del nivel freático,  $DW = 1.5$  y  $4.0 \text{ m}.$
- Profundidades estudiadas  $Z: 1-15 \text{ metros}$

PROYECTO \_\_\_\_\_ No. \_\_\_\_\_  
 Descripción \_\_\_\_\_  
 Calculó \_\_\_\_\_ Revisó \_\_\_\_\_ Fecha \_\_\_\_\_  
 Hoja 2 de 7

Método de Seed e Idriss (1982 y 1985) en función de :

- Magnitud del sismo
- aceleración máxima en la superficie del terreno,  $A_{máx}$
- $(N_1)_{60}$ , golpes por pie del ensayo de penetración estándar, SPT corregido por confinamiento y correspondiente a una eficiencia del 60% en la entrega de energía.
- Porcentaje de Finos :  $F' : \leq 5\%, 15\%, \geq 35\%$
- Relación de esfuerzos inducidos por el sismo

$$\tau_z / \sigma'_{vo} = 0.65 \frac{A_{máx}}{g} \frac{\sigma_{vo}}{\sigma'_{vo}} \Gamma_d$$

$$\Gamma_d = \text{factor de reducción} = 1 - 0.015 Z \quad (Z \text{ en metros})$$
